Press Release

May 25, 2007 Eastpointe, MI

Alternate Energy Solutions commences wind study in Midwest.

Alternate Energy Solutions wishes to report that two meteorological stations were installed in the Midwest earlier this month. The purpose for the tower installation is to evaluate wind resources on land that the company has acquired under a lease and development agreement (see news release dated February 12, 2007).

A crew of five individuals lead by Russ Lockhart, successfully and safely, installed two towers under challenging wind conditions. The installations are located six miles apart from one another on ranchland. The towers are located back on a plateau escarpment having a northern ridge. The ridge has a gradual slope which is approximately 200 ft. in height. Prevailing winds are from the northwest and north, with occasional wind coming from an eastwardly direction. The property is located in reasonable proximity to transmission and distribution circuits.

According to Russ Lockhart, “After the first tower was installed it came under severe thunderstorm, hail, and wind conditions the following evening. The storm came from the North and caused localized power failures and damage across eastern Wyoming, Montana and the western Dakotas. Strong, northern wind gusts were reported in excess of 75 mph. There was no damage to the tower.” The second tower was erected two days later. Both towers are operational and recording wind data.

Alternate Energy Solutions is a Michigan company specializing in development of renewable energy utilizing wind turbines, solar thermal collection and geothermal systems. Company services to clients include fatal-flaw analysis, wind testing and mapping, electrical system design and component specification, system operation, training and maintenance.
